ACCESSING & ADDING / UPDATING ITEMS
ACCESSING VALUES
Retrieve values using a key inside square brackets or with .get() for safe access.
student ={"name": "Alice", "age": 21}
# Using bracket notation
print(student["name"]) # Alice
Using .get() 4 returns None if key missing
print(student.get("grade")) # None
print(student.get("age", 0)) # 21
Use .get() to avoid a KeyError when the key might not exist.
ADDING & UPDATING ITEMS
Assign a value to a new key to add it, or to an existing key to
ate it.
tudent ={"name": "Alice", "age": 21}
# Adding a new key-value pair
student["grade"] ="A"
print(student)
# {'name': 'Alice', 'age': 21, 'grade': 'A'}
# Updating an existing key
student["age"] =22
print(student["age"]) # 22
# Update multiple at once
student.update({"age": 23, "city": "NY"})
print(student)
